Office Action Summary	Examiner	Art Unit			
	James A. Thompson	2624			
The MAILING DATE of this communication appears on the cover sheet with the correspondence address Period for Reply					
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION. - Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. - If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely. - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication. - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

DETAILED ACTION

Response to Arguments

- 1. Applicant's arguments, see page 6, filed 15 February 2005, with respect to the specification and the objections to claim 3 have been fully considered and are persuasive. The amendment to the specification has been noted and contains no new matter. The objection to claim 3 in item 2 of the previous office action, dated 10 November 2004, has been withdrawn.
- 2. Applicant's arguments, see pages 7-11, filed 15 February 2005, have been fully considered but they are not persuasive.

Applicant merely provides a summary of the amended claim, a very brief synopsis of Applicant's view of the primary reference, Yamazaki (US Patent 6,118,972), and the secondary reference, Nishida (US Patent 5,961,226), and a longer synopsis of Applicant's view of the tertiary reference, Tanaka (US Patent 5,973,797) that were applied in said previous office action. Applicant then simply alleges that the references cannot be combined, nor do the combination of references teach each and every limitation of newly amended claim 1. Further, Applicant argues that "the document size as taught in Tanaka et al. is not changed to read another document while the document on the table is maintained with the cover being closed" (page 10, lines 4-6 of the present arguments). However, Examiner has not suggested this and requests further clarification from Applicant where Applicant believes such an argument has been made.

Applicant has not attempted to refute any of the arguments made by Examiner in said previous office action. Therefore, Applicant's arguments fail to comply with 37 CFR 1.111(b).

because they amount to a general allegation that the claims define a patentable invention without specifically pointing out how the language of the claims patentably distinguishes them from the references.

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claim 1 is rejected under 35 U.S.C. 103(a) as being unpatentable over Yamazaki (US Patent 6,118,972) in view of Nishida (US Patent 5,961,226) and Tanaka (US Patent 5,973,797).

Yamazaki discloses a document reading device (figure 3 of Yamazaki) comprising a reading unit (figure 3(3) of Yamazaki) for reading an image of a document (column 8, lines 44-49 of Yamazaki); a document size detector (figure 3(S1) of Yamazaki) for detecting a size of the document (column 7, lines 15-20 of Yamazaki); a controller (figure 3(80) of Yamazaki) for controlling said reading unit to read the image of the document in a read size corresponding to the document size (column 10, lines 5-12 of Yamazaki) confirmed from a detection result of said document size detector (column 9, line 63 to column 10, line 5 of Yamazaki), wherein said controller includes a user interface (figure 3(80("switches, numeral keys, and a liquid crystal touch panel")) of Yamazaki) for inputting various

information (column 6, lines 20-24 of Yamazaki); and a document feeder (figure 1(2) of Yamazaki) for feeding a plurality of documents (column 6, lines 25-33 of Yamazaki). Yamazaki teaches that a user interface comprising switches, numeral keys, and a liquid crystal touch panel are a part of said controller (column 6, lines 20-24 of Yamazaki), though not specifically shown in figure 3 of Yamazaki.

Yamazaki does not disclose expressly that said user interface is used for outputting various information; that said controller includes read size specifying means for requesting designation of a document size via said user interface when the document size is not confirmable from a detection result of the document size detector and specifying the read size corresponding to the document size which is designated via said user interface according to the request; that said reading unit includes a document table for supporting a single document placed thereon and a cover capable of being opened and closed; that said read size specifying means is constructed such that the document size designated via said user interface is confirmed in a state where said cover is closed, and the document size is maintained until said cover is opened; that said reading unit is capable of reading an image of the other document fed by the document feeder while maintaining the document on the document table; and that said read size specifying means is constructed such that the read size for the document fed by the document feeder is independently specified from the read size for the document on said document table to maintain the document size designated for the document on the document table until the cover is opened.

Art Unit: 2624

Nishida discloses a user interface (figure 2(12,13) of Nishida) for inputting and outputting various information (column 3, lines 1-4 of Nishida). The keyboard (figure 2(12) of Nishida) and the crystal display (figure 2(13) of Nishida) constitute a user interface since both, in combination, are used to input and output relevant information (column 3, lines 1-4 of Nishida).

Nishida further discloses read size specifying means (figure 2(1) and column 3, lines 7-9 of Nishida) for requesting designation of a document size via said user interface (column 4, lines 50-57 of Nishida) when the document size is not confirmable from a detection result of a document size detector (column 4, lines 49-53 of Nishida) and specifying the read size corresponding to the document size which is designated via said user interface according to the request (column 4, lines 57-61 of Nishida); and that the read size specifying means includes a memory (figure 6 and column 4, lines 13-17 of Nishida) and is configured such that the read size for the document fed by a document feeder is independently specified by the user (column 4, lines 50-57 of Nishida) to maintain the document size designated for all scanning and printing in the memory (column 4, lines 57-61 of Nishida). The system control unit (figure 2 (1) of Nishida) controls the sheet setting mechanism (column 3, lines 7-9 of Nishida) based on the condition of the switches (column 4, lines 13-17 of Nishida). The switches, and their corresponding set condition, are a form of memory since the state of the switches is stored data which is modifiable based on changing conditions.

Yamazaki and Nishida are combinable because they are from the same field of endeavor, namely document size detection,

Application/Control Number: 09/847,843 Page 6

Art Unit: 2624

document processing, and document printing. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to include a user interface that allows the user to specify a document size and a read size if the document size is not recognized by the system, as taught by Nishida, wherein said document size detection is performed by the document size detector taught by Yamazaki. The motivation for doing so would have been that, if the document size cannot be determined by the system, a user should be able to input the data into the system, thus allowing the document processing to occur (column 4, lines 53-61 of Nishida). Otherwise, the system will not be able to process documents that are not a standard size. Further, at the time of the invention, it would have been obvious to a person of ordinary skill in the art to use the same independently specified document size for all the document images processed, as taught by Nishida. The motivation for doing so would have been to be able to process the plurality of document images faster (column 10, lines 5-9 and lines 12-17 of Yamazaki). Therefore, it would have been obvious to combine Nishida with Yamazaki.

Yamazaki in view of Nishida does not disclose expressly that said reading unit includes a document table for supporting a single document placed thereon and a cover capable of being opened and closed, and said read size specifying means is constructed such that the document size designated via said user interface is confirmed in a state where said cover is closed, and the document size is maintained until said cover is opened; that said reading unit is capable of reading an image of the other document fed by the document feeder while maintaining the document on the document table; and that said independently

specified read size is specified from the read size for the document on said document table until the cover is opened.

Tanaka discloses a document table (figure 1(16) of Tanaka) for supporting a single document placed thereon (column 7, lines 35-38 of Tanaka) and a cover (figure 1(24) of Tanaka) capable of being opened and closed (column 7, lines 57-62 of Tanaka), and that the document size is confirmed in a state where said cover is closed, and the document size is maintained until said cover is opened (column 18, lines 58-60 of Tanaka). The existence of a document (column 18, lines 52-57 of Tanaka) and the document size is only determined when the platen is in a closed state (column 18, lines 58-60 of Tanaka). Therefore, the detected document size is maintained until said cover is opened.

Tanaka further discloses reading a document on said document table and determining the document size (column 18, lines 52-57 of Tanaka); and specifying a read size from the read size for the document on said document table until the cover is opened (column 18, lines 58-60 of Tanaka).

Yamazaki in view of Nishida is combinable with Tanaka because they are from the same field of endeavor, namely document size detection, document processing, and document printing. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to include the document table and the cover taught by Tanaka as part of the overall reading unit and, when the read size specifying means designates a size via a user interface, as taught by Nishida, the document size is confirmed (determined) in a state where said cover is closed, as taught by Tanaka. The motivation for doing so would have been to be able to accurately determine the document size, regardless of the background color of the

Application/Control Number: 09/847,843

Page 8

Art Unit: 2624

document (column 6, lines 11-20 of Tanaka). Furthermore, at the time of the invention, it would have been obvious to a person of ordinary skill in the art to use the read size determined for the document on said document table, as taught by Tanaka, as the read size for all of the document images to be read and processed, as taught by Nishida, since Nishida teaches that, when a document size is specifically determined, said document size is used for processing the document images (column 4, lines 42-46 and lines 57-61 of Nishida). The read size determined by the document table taught by Tanaka is simply used as the input. The motivation for doing so would have been that, by setting all the document sizes to a predetermined size (column 10, lines 5-9 of Yamazaki), the document image processing can be performed faster (column 10, lines 12-17 of Yamazaki). Further, since the document table taught by Tanaka is included as part of the reading unit taught by Yamazaki, and is thus separate from the document feeder taught by Yamazaki, then said document feeder feeds documents other than the document on said document table and said reading unit is capable of reading an image of the other document fed by the document feeder while maintaining the document on the document table. Therefore, it would have been obvious to combine Tanaka with Yamazaki in view of Nishida to obtain the invention as specified in claim 1.

Conclusion

5. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, THIS ACTION IS MADE FINAL. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to James A. Thompson whose telephone number is 571-272-7441. The examiner can normally be reached on 8:30AM-5:00PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, David K. Moore can be reached on 571-272-7437. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only.
